Test Plan & Report – Cybersoft Movie Booking (demo1)

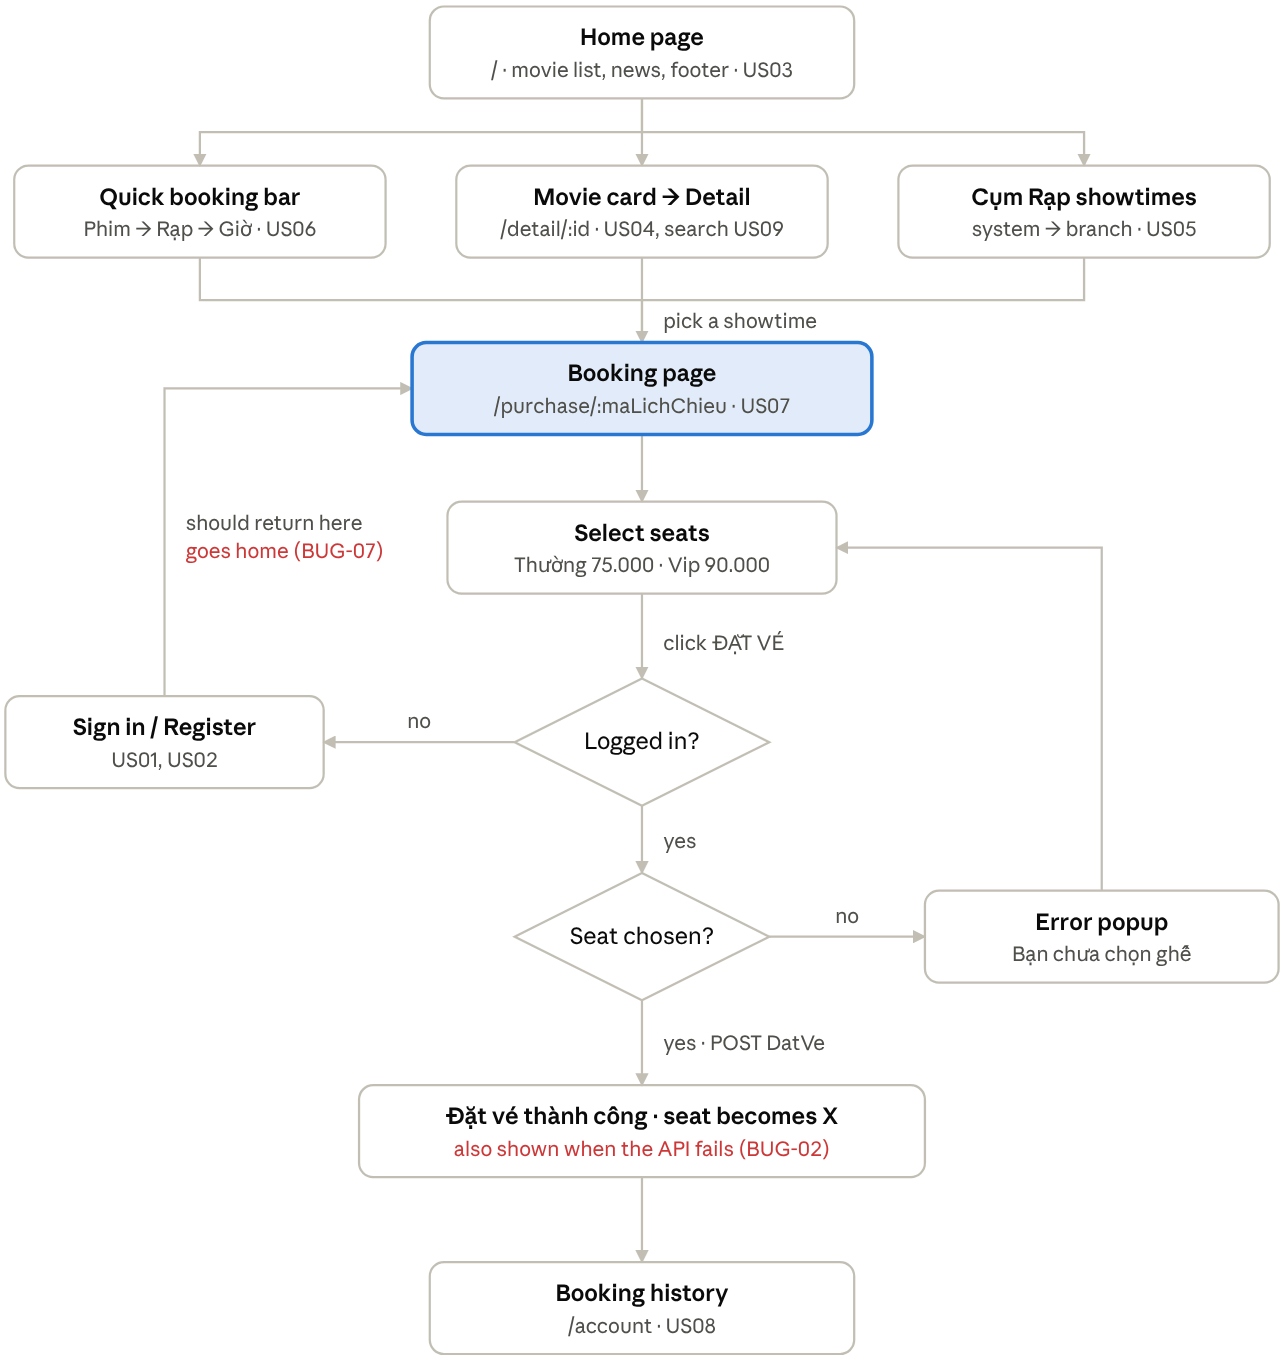

Nov 11, 2026 · @Sodacarrot

This plan covers the Epic **Đặt vé xem phim** on https://demo1.cybersoft.edu.vn: 9 user stories, 94 test cases, 77 automated (82%). Manual execution plus the first automation run found 18 defects, 3 of them Critical, so the booking flow is **not ready for release**.

Epic flow

Every path ends on the same booking page, so US07 carries the most risk and the most test cases (18).

Three ways into one booking page, two checks before the ticket

Epic flow · Đặt vé xem phim · US01–US09

A guest can browse everything; login is only demanded at ĐẶT VÉ. Red notes mark where round 1 found the flow breaking.

Scope

The customer-facing booking journey is in scope: nine user stories, from registration to booking history, on desktop and mobile.

ID	Feature	Test cases	Automated	Business priority
US01	Đăng ký tài khoản (register)	12	10	High
US02	Đăng nhập / Đăng xuất (login, remember me, logout)	13	12	High
US03	Trang chủ & danh sách phim (home, trailer, news, footer)	14	11	Medium
US04	Chi tiết phim & lịch chiếu (movie detail)	10	6	High
US05	Lịch chiếu theo cụm rạp (showtimes by cinema)	4	3	Medium
US06	Đặt vé nhanh (quick booking bar)	8	7	High
US07	Chọn ghế & đặt vé (seat selection, booking)	18	16	Highest
US08	Tài khoản & lịch sử đặt vé (profile, history)	9	7	Medium
US09	Mobile layout & tìm kiếm phim (search)	6	5	Medium
Total		**94**	**77 (82%)**	

Out of scope:

- Admin pages (/manage-user, /manage-movie): only their access control is tested.
- Payment: the site has none; a booking is saved directly.
- Performance, load and penetration testing.
- Browsers other than Chromium; Firefox and WebKit can be added as Playwright projects later.
- Editorial content of news and app-promotion blocks.

Approach

Testing is black-box at system level through the UI, backed by API checks against the public backend (movie0706.cybersoft.edu.vn).

Technique	Where it is used
Equivalence partitioning + boundary values	Password length 5 vs 6, email formats, name with digits, username rules
Decision table	Quick booking bar: film / cinema / showtime selected or missing → 4 outcomes (TC_QB_04–07)
State transition	Seat: free → selected → deselected / booked (X); session: guest → logged in → logged out
Error guessing	Invalid movie id, expired showtimes, API failure during booking, double booking
Data consistency	Same showtime compared on detail page, booking page and API
Source review	Production JavaScript read for flows that cannot be triggered safely by hand (booking error handling, remember-me storage, role field)

Sanity set: 21 cases marked **Sanity = Y** in the workbook. They cover the critical path (home → movie → showtime → seat → booking → history) and run first on every build.

Automation (Playwright + TypeScript, Page Object Model):

- Target 40% of test cases automated; achieved 77 of 94 (82%).
- Each test creates its own customer account through the API, so tests are independent and repeatable.
- Tags: `@smoke` for the sanity path, `@bug` for tests that reproduce an open defect and are expected to fail until it is fixed.
- Every failure saves a full-page screenshot, video, trace and a step log.

Environment, tools and test data

Item	Value
Application	https://demo1.cybersoft.edu.vn (React SPA, Material UI)
Backend API	https://movie0706.cybersoft.edu.vn/api, group code GP09
Browsers	Chrome / Chromium (manual + automation)
Viewports	Desktop 1440×900 (the desktop menu collapses below ~1280px); mobile 375×812 manual, Pixel 5 in automation
Test management	Excel / Google Sheets workbook: Test Cases, Bugs, Summary
Automation	Playwright, TypeScript, Node 20, HTML + JUnit + JSON reports (Allure optional), GitHub Actions
Debug tools	Chrome DevTools: Network, Application → Local Storage, Console

Test data:

- Accounts: automation registers a fresh account per test (`qa<timestamp>` / `Auto@123456`). Manual testers create their own; no shared credentials are stored.
- Reference movie: Man of Steel (maPhim 9387), showtime 45052 at CNS Quốc Thanh, fully booked.
- Free-seat showtime: 44807 (John Wick, BHD Star Phạm Hùng); automation finds one dynamically.
- Seat prices: Thường 75.000 VND, Vip 90.000 VND.
- Full list: *Test Data* tab of the workbook.

Entry and exit criteria

Entry criteria:

- Site and API reachable; home page loads movies.
- User stories and acceptance criteria agreed (workbook, *User Stories* tab).

- Test cases reviewed; sanity set marked.
- Automation suite runs green on `npm run test:stable`.

Exit criteria for release:

- 100% of sanity cases executed and passed.
- ⩾ 95% of all test cases executed; ⩾ 90% of executed cases passed.
- No open Critical or Major defects; every Minor defect has an owner and a target date.
- Automation coverage ⩾ 40%.

Severity is how badly a defect hurts the product; priority is how soon it must be fixed.

Severity	Meaning	Example here
Critical	Wrong money/ticket outcome, data or security exposure, no workaround	Success shown for a failed booking (BUG-02)
Major	Core feature gives wrong result; workaround exists	Wrong showtime on booking page (BUG-01)
Minor	Secondary feature or UX broken	Blank page for invalid movie id (BUG-06)
Trivial	Cosmetic	Trailing comma in seat list (BUG-14)

Priority	Fix by
Highest	Before any release, now
High	This release
Medium	Next release
Low / Lowest	When capacity allows

Schedule, roles and deliverables

No deadline is set in the assignment, so phases are given as effort; put your team's dates in the last column.

Phase	Output	Effort	Owner	Dates
1. Analyse epic, write user stories	Epic flow, US01–US09	0.5 day	Team	
2. Test plan	This document	0.5 day	Test lead	
3. Test design	94 test cases, test data	1 day	Testers	
4. Execution round 1 + bug reporting	Results, 18 bugs	1 day	Testers	
5. Automation framework	Playwright repo, 77 automated cases	2 days	Automation tester	
6. Execution round 2 (account-based cases) + retest	Updated results	0.5 day	Testers	
7. Report + presentation	Test report, slides	0.5 day	Team	

Deliverables:

1. Test plan and test report (this document).
2. Workbook `Cybersoft_Movie_Testing_Workbook.xlsx`: Summary, Test Cases with execution results, Bugs, User Stories, Test Data, Automation Map.
3. Automation repository `cybersoft-movie-automation` (public Git link).
4. Slides presenting the framework.

Risks and mitigations

Risk	Impact	Mitigation
Shared demo database: other students book seats and add junk data	Flaky seat tests, fully booked showtimes	Automation picks a showtime with free seats via API at run time; no hard-coded seats

Risk	Impact	Mitigation
Demo site or API down / slow	Runs fail for reasons outside the app	Generous timeouts, 1 retry on CI, API reachability shows up in the step log
Accounts pile up on the shared backend	Clutter for others	Unique short usernames, one account per test only where login is needed
No requirements document	Expected results are our interpretation	Acceptance criteria written in US01–US09 and reviewed with the team
Some flows cannot be triggered safely by hand (API failure, role change)	Bugs found by code reading only	Automation reproduces them with mocks or on our own test account (TC_BOOK_12, TC_ACC_04)
Layout changes below ~1280px	Desktop locators break on small windows	Viewport fixed to 1440×900; mobile has its own project

Test report – round 1 + first automation run (11/11/2026)

Manual round 1 plus the first automation run (the 11 smoke tests) executed 73 of 94 cases: 52 passed, 21 failed, 1 blocked. The release is blocked by 3 Critical defects in booking and login.

Result	Cases	Share
Pass	52	55%
Fail	21	22%
Blocked	1	1%
Not run	20	21%
Total	**94**	

The automation run found BUG-18 (no profile on the account page), which blocks TC_ACC_02. Of the 20 not-run cases, 11 are automated and fill in with the full suite (`npm test`); the other 9 are manual-only. Executed cases pass at 71% (52 of 73).

Open defects	Highest	High	Medium	Low	Lowest	Total
Count	2	4	4	6	2	**18**

Top defects to fix first:

Bug	Summary	Severity	Priority
BUG-02	'Đặt vé thành công' shown even when the booking request fails; errors swallowed	Critical	Highest
BUG-09	Customer profile form offers the 'Quản Trị' (admin) role; to confirm on own account	Critical	Highest
BUG-08	'Nhớ tài khoản' saves the password in plain text in localStorage	Critical	High
BUG-01	Booking page shows the wrong time (hour : month, e.g. 23:53 → 11:04)	Major	High
BUG-05	Showtimes from 2019–2021 still listed and bookable	Major	High
BUG-18	Account page shows no profile for a new customer; profile is looked up by full name	Major	High

Recommendation: do not release. Fix BUG-02, BUG-08 and BUG-09, plus BUG-01, BUG-05 and BUG-18. Then run round 2: the full automation suite, the 9 manual-only cases, and a retest of every fixed bug. Every bug has steps, expected/actual and evidence in the workbook's *Bugs* tab.
